The present invention relates to a buffer circuit, and more specifically to a buffer circuit that includes an input buffer, a power supply voltage detecting circuit, an output determining circuit, and an output buffer. Conventional buffer circuits are illustrated in FIGS. 7 and 8. FIG. 7 illustrates a circuit which includes an input buffer circuit for inputting logic signals from outside, an internal power supply voltage detector circuit for generating an output value corresponding to an internal power supply voltage, an output determining circuit for determining an output value by taking advantage of the logic value of the input signal, and an output buffer circuit for outputting the output value. In FIG. 7, V.sub.DD denotes a power supply voltage applied to the input buffer circuit, V.sub.INT denotes an internal power supply voltage, and V.sub.out denotes an output value output from the output buffer circuit. The input buffer circuit comprises a P-channel transistor P1 and an N-channel transistor N1. A gate of the P-channel transistor P1 is supplied with a power supply voltage V.sub.DD through the source and the drain, and a gate of the N-channel transistor N1 is supplied with an input signal V.sub.IN through the drain and the source. The input signal V.sub.IN is supplied to the input buffer circuit through an input pad 202. The internal power supply voltage detector circuit comprises a P-channel transistor P2 and an N-channel transistor N2. The gate of the N-channel transistor N2 is supplied with the internal power supply voltage V.sub.INT through the source and the drain, and the gate of the P-channel transistor P2 is supplied with the input signal V.sub.IN through
