A: You forgot to replace / with - in part 1. See the documentation on the url()-function for further details. I also simplified your regex-pattern. function url(input) { return new URL(input).href; } document.write(url(input.value)); document.write(url(input).textContent) Q: How to apply onClickListener to all buttons? I'm quite new to Android development and I'm trying to put together a simple app that will allow a user to click on a button which will then affect the message displayed at the top of the screen in the textviews shown below. I'm trying to be DRY but I can't get it to work. In some previous similar questions I've seen people suggest overriding the onClick method but this didn't appear to work in this case. The code below is inside my main activity file. The if (i==4) { t2.setText("Message 1"); } else if (i==5) { t3.setText("Message 2"); } else if (i==6) { t4.setText("Message 3"); } else if (i==7) { t5.setText("Message 4"); } is repeated numerous times, so it makes it very hard for me to manipulate it and have it work across the board. How can I set a listener to each button? Thanks in advance! A: You could use an arraylist containing all of the button instances to loop through them all, and then set the text in the textviews accordingly. Example: ArrayList btn = new ArrayList(); btn.add(YourButtonName); //add all the buttons you want to use for(Button b : btn) { b.setOnClickListener(new ButtonListener()); } private OnClickListener ButtonListener() { //set the text here } EDIT - just realised if the buttons are already all defined in the xml d0c515b9f4
