
Multikey Emulator 64 Bit !EXCLUSIVE!

I accepted his request to help him. I noticed that he had Windows 7 64-bit Professional installed on his PC. I have searched the internet and read many web pages about .NET Framework 4 but nothing told me how to fix c0000145 errors. Ultimately, I found that this error could have been caused by a missing .dll file in the Windows\System32 folder. I found that if I give admin rights to my friend's computer that had Windows 7 installed, all of this happens. I can't figure out why I couldn't detect this error when I was working on my own computer.
