Luckily, the above gripes do not lower the high praise for the update as you might see here on LT. The most important update for me happens to be the fact that this software is finally being moved to 64-bit processing and its database is no longer limited to 16-bit. I also have huge fondness for the fact that Photoshop is no longer limited to one folder. You can store your images where you want, allowing for a more flexible workflow. This previous point is really an anti-feature as it was done to make it easier to save your images with the browser and use Lightroom application. But this is something that many users consider as a negative one now. The dozens of folders that used to be in Lightroom can be found in the browser and the application is faster too. Finally, since Lightroom now treats RAW images as abstract data that it can apply to the specific frame of the camera, it no longer has to be bothered by how the metadata is stored. Importantly, Lightroom has stored the exact information on which image was imported for the time being. This means that the location of the original files can be very useful if you have to run into any issues with the drive where you store your files. That is a correct statement, then, though not exactly the way one may want to word it. But it is noteworthy that

Lightroom no longer needs to be updated on top of every new version of Photoshop, which used to be the case in the past. You can start using Lightroom as a standalone application. So getting it linked with Photoshop will be even faster.

But still, the eye opening statistic is still a reminder that this is a company with an enviable track record. One of one of the richest tech companies in the world, perhaps, the company has also found its solid foothold in publishing. Although Microsoft would probably take a lot of the credit - with a \$26 billion takeover in 2018 many have joked that the company has now surpassed the industry giant in both market and revenue share. Adobe has expanded its developer community, recently announced the next iteration of their Photoshop line - with a focus on delivering on the company's blurring between the designer and the developer, make products that are built using the APIs provided by a brand new universal runtime. This could also be a hint that they could be working on some of their mobile-first applications. It's all about appealing to a broader audience, and with the set to continue delivering on that sales target as Windows and Mac run through the 20th anniversary year in 2020, perhaps they'll even look for further development on iOS, Android and potentially some other platforms - after they've released a standalone version on iOS. All that said, the future is looking bright, and there will be many more features that we're yet to see. There's a lot that still remains to be discovered. As for now we can peak behind the curtain to explore some of the major additions in the coming year. If perhaps the most glaring omission in Photoshop Elements is the lack of layers. With Photoshop, one can group images into a layer, add text and other items, and organize the groups however you choose. Even with Elements' simplified user interface, it can be a bit daunting initially, but individual layers can provide useful organizational capabilities.
